One-Shot AI Website Builder Pack

Vibe code your next landing page in minutes.

5 reusable systems | No-Code | Claude · v0 · Lovable · Bolt.new | No-Code Automation | Coding

Setup checklist

- [ ] Define the exact tech stack (React, Tailwind, Lucide).
- [ ] Provide a clear project description and target audience.
- [ ] Specify the layout structure and required sections.
- [ ] Request complete, runnable code without external dependencies.

The 5 copy-paste prompts

[INDIGO] = fill in · **[AMBER]** = paste your material

1 The Foundation (Landing Page)

Generate a complete, responsive landing page.

```
You are an expert UI/UX designer and frontend developer. I need a
complete, responsive landing page for my project.
[PASTE YOUR PROJECT DESCRIPTION HERE]
Target Audience: [TARGET_AUDIENCE]
Brand Colors: [PRIMARY_COLOR] and [SECONDARY_COLOR]
Key Features: [FEATURE_1], [FEATURE_2], [FEATURE_3]
Task: Generate the complete frontend code using React, Tailwind CSS, and
Lucide icons. The design must be modern, clean, and highly converting.
Include a hero section with a compelling headline and call-to-action, a
features grid highlighting the key benefits, a social proof or testimonial
section, and a simple footer. Ensure the layout is fully responsive,
looking perfect on both mobile and desktop devices. Use semantic HTML and
accessible design patterns. Do not use external images; use placeholder
colored blocks or Lucide icons instead. Add subtle hover states to all
buttons and interactive elements. The final output should be a single,
cohesive component ready to be rendered in a tool like v0, Lovable, or
Bolt.new without requiring any additional configuration.
```

2 The Interactive Dashboard

Build a modern admin dashboard interface.

```
You are a senior frontend engineer specializing in data visualization and dashboard design. Build a modern admin dashboard interface.
[PASTE YOUR DATA STRUCTURE OR METRICS HERE]
Industry: [INDUSTRY_NAME]
Main KPI: [PRIMARY_KPI]
Task: Create a responsive React and Tailwind CSS dashboard layout. It must include a sidebar navigation menu with icons for Dashboard, Analytics, Users, and Settings. The main content area should feature a top header with a search bar and user profile dropdown. Below the header, create a grid of summary cards displaying key metrics with percentage changes (e.g., +5% from last month). Include a large central section for a chart or data table representing the core data provided. Use Lucide icons for all iconography. The design should be sleek, utilizing a light mode theme with subtle borders and shadows for depth. Ensure all components are modular and the code is clean. The UI must feel interactive, with hover effects on sidebar links and table rows. Output the complete code ready for instant preview.
```

3 The E-commerce Product Page

Design a high-converting e-commerce product page.

```
You are a conversion rate optimization expert and frontend developer.
Design a high-converting e-commerce product page.
[PASTE PRODUCT DETAILS AND PRICING HERE]
Product Category: [PRODUCT_CATEGORY]
Unique Selling Proposition: [USP]
Task: Develop a responsive product page using React and Tailwind CSS. The layout should feature a split-screen design on desktop: an image gallery on the left (using placeholder blocks) and product details on the right. The details section must include the product title, price, star rating, a clear 'Add to Cart' button, and an accordion for product description, specifications, and shipping information. Below the main product area, add a 'Frequently Bought Together' or 'Related Products' carousel section. Use a clean, minimalist aesthetic that puts the focus entirely on the product. Implement interactive elements like a quantity selector and color/size variants if applicable. Ensure the mobile view stacks elegantly, keeping the 'Add to Cart' button prominent. Use Lucide icons for UI elements like stars, shipping trucks, and arrows. Provide the full, runnable code.
```

4 The SaaS Pricing Page

Create a compelling, high-converting pricing page.

```
You are a SaaS growth hacker and UI developer. Create a compelling, high-converting pricing page for a software product.
[PASTE PRICING TIERS AND FEATURES HERE]
Product Name: [PRODUCT_NAME]
Target Customer: [TARGET_CUSTOMER]
Task: Build a responsive pricing page using React and Tailwind CSS. The page should start with a clear, benefit-driven headline and a toggle switch for Monthly/Annual billing. Below this, display three pricing cards: Basic, Pro, and Enterprise. The 'Pro' card should be visually highlighted as the most popular choice, using a distinct border or background color and a 'Best Value' badge. Each card must list the price, a short description, a prominent call-to-action button, and a checklist of included features using green checkmark icons from Lucide. Below the pricing cards, include a comprehensive feature comparison table and a Frequently Asked Questions (FAQ) accordion section. The design must be trustworthy and professional, utilizing ample whitespace and clear typography. Ensure the layout is fully responsive, stacking the pricing cards vertically on mobile devices. Output the complete, functional component.
```

5 The Waitlist/Lead Gen Form

Design an engaging waitlist capture page.

```
You are a lead generation specialist and frontend developer. Design an engaging waitlist capture page for an upcoming product launch.
[PASTE VALUE PROPOSITION AND LAUNCH DETAILS HERE]
Incentive: [SIGNUP_INCENTIVE]
Brand Vibe: [BRAND_VIBE]
Task: Create a highly focused, single-screen landing page using React and Tailwind CSS. The primary goal is email capture. The layout should be centered, featuring a bold, curiosity-inducing headline, a brief subheadline explaining the value proposition, and a sleek email input form with a high-contrast 'Join Waitlist' button. Include a micro-copy below the button mentioning the signup incentive or a privacy guarantee (e.g., 'No spam, ever'). Add a subtle background pattern or gradient to make the page visually appealing without distracting from the form. Incorporate social proof, such as 'Join [NUMBER] others already on the list,' or small avatar bubbles. Use Lucide icons for visual accents. The design must be flawlessly responsive and optimized for fast loading. Provide the complete code so it can be immediately rendered and tested in a vibe coding environment.
```

Tools

v0 by Vercel	Generates React and Next.js code from natural language prompts.
Lovable	Turns text prompts into full-stack web apps using React, Vite, and Supabase.
Bolt.new	AI-powered web development agent running directly in the browser.

Pro tips

- Always specify 'React and Tailwind CSS' to ensure the AI generates modern, easily editable code.
- Ask the AI to use 'Lucide icons' and 'placeholder colored blocks' instead of external images to prevent broken links.
- If the layout breaks, prompt the AI with the specific error message or ask it to 'fix the mobile responsiveness'.
- Use a vibe coding platform like v0 or Bolt.new to instantly preview the generated code without setting up a local environment.
